

the latest building revolution

An extruded durable clay unit with clever profiled edges and a tile-shaped front face which replicates a tile-hung wall elevation when mortared together. Tile-hung elevations are frequently chosen between first floor level and eaves to create a decorative alternative to brickwork.

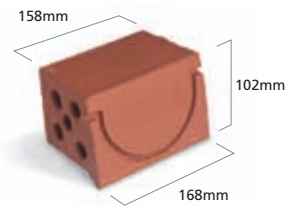

The Tilebrick™ now enables a bricklayer to continue from ground level to eaves using traditional brick and block construction with none of the additional costs and skill requirements associated with traditional tile-hanging. It looks like traditional tile-hanging, yet has the benefits of structural masonry.
